
BACK-END WEB DEVELOPMENT

ENGLISH SHEET - UNIT 1

1. VOCABULARY

Back-end: Part of an online product that runs in a server. To be considered a full back-end it should, at least: respond to requests (such as HTTP), change its behavior and store data in a permanent storage.

Web server: Software that responds to HTTP requests. It also runs in a server.

App server: Software that responds to HTTP requests and changes its behavior. It could be considered some kind of back-end.

Framework: Set of libraries with previously written code that streamlines the workflow.

HTTP: One of the many internet protocols that exist. It's a client/server text protocol with a very short lifespan.

Module: Piece of code that works independently and is able to communicate with other modules.

Interface: Piece of code that connects two different parts of an application.

Scalability: Property of an application that measures how easily can a project be expanded in size or in functionalities.

Flexibility: Property of an application that measures how easily can we modify an existing functionality

2. EXERCISES

1. Draw an HTTP request/response cycle that shows: A users logs in to Amazon and then searches "laptop computer". Include requests to the database if necessary.
2. In your own words: When is a back-end necessary?
3. Watch this [video](#). What are the HTTP methods? What are they for?

3. WRITING

Make a short comparison between two back-ends of your choice. Know that we will be using Django in class, but you can choose your favorites.
